is by the end-user to the partner/distributor, who then provides it to us. In order to make the data available to our partners/distributors, they have to agree to a specific licensing agreement with us. They have to pay an upfront fee to us and are then allowed to sell licenses directly to end-users. They can then keep the licensing revenue (this is the 'traditional' way of doing things in the market). However, they can also charge a percentage of the licensing fee they make to the end-user to us. This percentage is called the 'transaction fee'. There is no direct relationship between the two parties; only one of them is the end-user and the other one is the distributor/partner. \*\*Input parameters.\*\* The input parameters to the model are the number of license sales, the number of customers, the average revenue per customer, the average revenue per license and the end-user discount. All input parameters are the same for all model runs and were derived from the historical data set. \*\*Output parameters.\*\* The output parameters are the expected total annual revenues, the expected total annual costs, the expected gross profit margin and the expected gross profit margin relative to the total revenues. All output parameters are the same for all model runs and were derived from the historical data set. We used the above model to analyse the market for HAI based on a historical data set from January 2010 to December 2013. The input parameters to the model are the number of licenses sold, the number of customers and the average revenue per customer. The model was run for 100 different scenarios, where each scenario is a different combination of input parameters. This enables us to analyse the effect of each of the input parameters on the market. Results and discussion [9Sec7] ===== In this section, we will discuss the results obtained from the model for all 100 different scenarios. These results will show the total annual revenues and the total annual costs for all scenarios. We will also analyse the expected gross profit margin for all scenarios and compare the gross profit margin to the total revenues for each scenario. We will do this by first taking the total revenues and the gross profit margin and subtracting them to get the gross profit margin relative to the total revenues. This will allow us to see if the gross profit margin is high, medium or low compared to the total revenues. In addition, we will calculate the expected gross profit margin relative to the 821574766
